EXPERIENCE

Microsoft — Seattle, WA

Software Engineer II **Aug 2024 – Jul 2026**

- Built and launched the Kubernetes-hosted consent service implementing opt-in consent for price increases, launching in 2 pilots and maintaining pricing compliance for tens of thousands of subscriptions.
- Achieved >99.5% accuracy in recording customer consent across the subscription platform through shadow testing and production validation and reduced incident detection to 15 minutes through monitoring.
- Secured the consent service with service-to-service token authentication via OAuth, managed identities, and least-privilege access, validated through a threat-modeling review.
- Generalized the consent service's infrastructure into a reusable API service template, subsequently adopted to create a new service.
- Centralized subscription-specific date logic in renewal-information APIs, representing the team in partner negotiations to design a generic, backward-compatible integration pattern meeting 5+ teams' compliance data needs.
- Enabled safe support for multiple recurrences of the same type by updating catalog contracts, storage models, and subscription-evaluation logic behind feature flags, clearing the way for new subscription-type offerings.

Software Engineer **Aug 2021 – Jul 2024**

- Reduced event-generation latency for the revenue-recognition service from days to seconds by building a distributed, event-driven pipeline processing millions of daily events, paving the way to replace a legacy system with multi-million-item backlogs.
- Hardened the subscription service with network isolation and Azure Key Vault secret management, and maintained PII-safe logging and audit trails.
- Eliminated 3+ hours of lag in team data pipelines generating renewal candidates, email-notification candidates, and recurrence data by migrating them to Azure Data Factory with infrastructure as code and staging-validated deployments.
- Supported SOX audits and data fixes by maintaining reconciliations and pulling subscription data on request, providing audit evidence and data traceability.

SKILLS

Languages: C#, Python, PowerShell, KQL
Backend: .NET, ASP.NET Core, REST APIs, distributed systems, event-driven microservices
Cloud and Data: Azure Cosmos DB, SQL Server, Event Hubs, Azure Data Factory
Infrastructure: Kubernetes, Docker, Bicep, Azure DevOps, CI/CD, Git
Reliability and Security: OpenTelemetry, observability, OAuth, JWT, Azure Key Vault

EDUCATION

B.S. Computer Science, Cornell University, GPA 3.75 **May 2021**

VOLUNTEERING

Community Tech Support, Kin On **2024 – Present**

- Provide free one-on-one technology assistance for AAPI older adults, helping troubleshoot devices, applications, online accounts, and everyday technology issues.
